# HotDocs Developer

Create intelligent templates with the world's most powerful document assembly software

HotDocs Developer is an award-winning software application that significantly reduces the time spent creating customised documents, such as contracts, trusts and loan applications. With HotDocs, users transform any word processor or PDF document into a replicable, interactive template that guides the user through a series of relevant questions, resulting in a compliant and accurate document suited precisely to their needs and requirements. What's more, the flow of the dynamic interview process can be altered on-the-fly to meet the needs of different users. Data captured during the interview, along with data from other applications, can be saved and reused to pre-populate any additional questions.
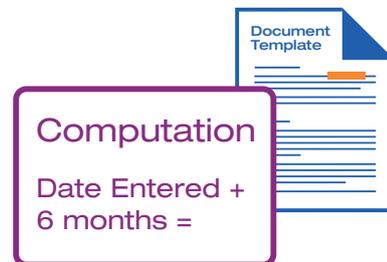

Transform Microsoft Word documents and PDF forms into interactive templates that enable a user to easily enter data and generate client specific, error-free versions of a document or suite of documents.
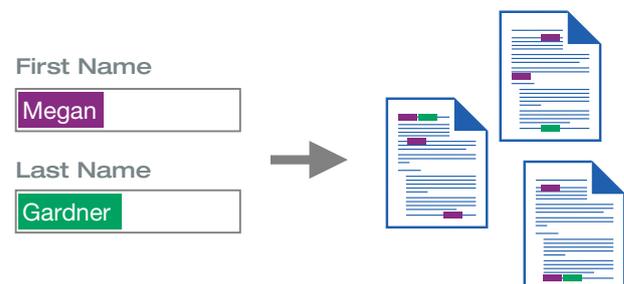

Automate documents by inserting variables using a simple, select-and-click approach. HotDocs automatically creates a question for each variable used within a document.

Include computations, formulas and conditional logic for advanced automation.

Build custom, interactive interviews for data gathering. Include range validation and help resources for individual questions.

Save answers in Answer Files that can be used to automatically populate questionnaires for any related documents.

Once documents are transformed into intelligent HotDocs templates, they can be deployed on the desktop, in your own server environment or in the cloud.
